All sizes and weights are nominal and the Company reserves the right to modify dimensions without notice. If dimensions or weights are critical please state when ordering.

Product ID STG Unity Block Seating Options

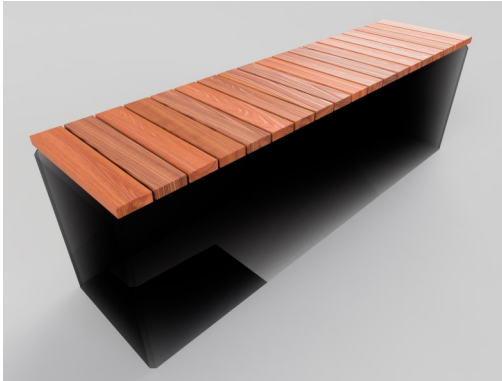

Examples of seating options can be seen throughout the rest of the specification sheet on a variety of block sizes. Some images show trick stoppers which do **NOT** come as standard contact the sales team for more information. Timber is Sapele as standard, add IK to the end of the code for Iroko and i.e. STG___BIK for an Iroko bishop seat top.

If you would like samples of the different timber options please contact the sales team
Note that oily hardwood timbers are susceptible to tannin bleed under the right atmospheric conditions. Contact the sales office for more information.

Maintenance and Product Care

Timber Maintenance

Where wood has been used for the products purchased there are specific things that need to be taken into consideration re its use and performance. The main points to note are that the assemblies will need some basic maintenance to get the maximum life from it to preserve its appearance and performance. A visual check should be completed at least every 3 months or more frequent whereby any splinters or sharp edges of wood are lightly sanded to remove them. This will ensure that any user of the product does not get injured. Where timber has been supplied the wood should be coated with Danish oil or a suitable substitute to preserve its appearance and longevity. These are as below, which is dependent on wood supplied. If the wood starts to deteriorate and its aesthetic value cannot be maintained, then it should be changed for a like for like replacement. Where replacement is made, then there will be shading difference against any wood that remains. This is due to the weathering effect of wood in service.

Tannins in Hardwood timber

Tannins are present in all hardwood timber and are a natural part of the timber itself. It is stored within the internal Grains of the wood which, when water or moisture permeates through the timber, can sometimes bring these tannins to the surface causing black or brownish staining to nearby surfaces.

Discolouration

Given that majority of the products Townscape supply with timber will be situated outside it is to be expected that a natural environment will have an effect on its colour. Heat/cold, Sunlight, Moisture and any other condition which the timber might come in contact with will likely lead to a noticeable physical change to its colour. As previously mentioned in this document a coating of Danish oil or a suitable substitute should ideally be applied every 6 months to help preserve any timber's appearance.

Natural colour variation

As mentioned before timber is an organic material meaning that variance in colour and grain is natural and should be expected.

Knots

Knots can be formed on the surface of timber creating dark blemishes which can become more prominent when stained. Relative to other timbers Sapele doesn't commonly knot.

Grain

Sapele is a hardwood that can form a variety of different grain patterns which is a contributing factor to the natural variation of colour. Pommel, quilted, mottled, wavy, beeswing and fiddleback are all grain patterns which could form.

Shakes

Shakes are cracks which form along the ring of a timber. They can be formed by the exposure to natural environments or parts of the timber shrinking at different rates amongst other things. They are more commonly noticeable at the end of the timber slat.

Splits

Splits in timber occur during the drying phase of production due to uneven shrinkage between the centre and outer sections of the timber slat. There is no concern about the structural integrity of the wood so long as the split does not go through the entire length of the slat.

Sap

Sap is a natural exudate from all trees. Sap can be left trapped in the timber after the manufacturing process. When the temperature rises sap can ooze out of the surface. Applying Danish oil will keep the surface sealed and reduce likelihood of sap seeping out.
